Figure 1 is a line graph showing the dose-response curves for HT-29 cells treated with various compounds. The Y-axis represents the percentage of control cell viability (% of Control), ranging from 0 to 120. The X-axis represents the drug concentration in micromolar (μM), ranging from 0.001 to 100. The legend identifies the following compounds and their corresponding symbols:

- SL-11093: Filled circle
- SL-11098: Open circle
- SL-11099: Filled square
- SL-11100: Open square
- SL-11101: Filled triangle
- SL-11102: Open triangle
- BE-4-4-4: Filled diamond

The graph shows that all compounds exhibit a dose-dependent decrease in cell viability. SL-11099 and SL-11100 show the highest potency, with significant inhibition observed at concentrations as low as 0.01 μM. SL-11101 and SL-11102 show intermediate potency, while SL-11093, SL-11098, and BE-4-4-4 show the lowest potency, with significant inhibition only observed at concentrations of 1 μM or higher. Error bars are included for all data points.
